Re: Proxy Voting and Shareholder Rights NPRM
Fiduciary Duties Regarding Proxy Voting and Shareholder Rights (RIN 1210-AB91)

Dear Acting Assistant Secretary Wilson,

The Interfaith Center on Corporate Responsibility (ICCR) is a broad coalition of institutional investors collectively representing over \$500 billion in invested capital. ICCR members believe, based on both empirical research and nearly 50 years of experience engaging companies, that meaningfully addressing environmental and social risks and adopting governance arrangements that promote accountability best position companies for long-term success.

ICCR writes to express our strong opposition to the Department of Labor's (the "Department's") proposed changes to fiduciary standards under the Employee Retirement Income Security Act of 1974 ("ERISA"), "Fiduciary Duties Regarding proxy Voting and Shareholder Rights" (the "Proposed Changes"), set forth in the Notice of Proposed Rulemaking ("NPRM").

The Proposed Changes, which would require ERISA fiduciaries to conduct vote-by-vote analysis of economic impact in order to cast proxy votes, are a transparent effort to discourage ERISA fiduciaries and their service providers from exercising their shareholder rights at portfolio companies. The Department should withdraw the NPRM because:

1. The NPRM offers no coherent justification for the Proposed Changes and reflects an unwarranted skepticism about shareholder voting, shareholder proposals and environmental, social and governance ("ESG") considerations.
2. The NPRM fails to discuss the abundant empirical research showing benefits from both shareholder voting and the kinds of ESG reforms it makes possible;

that omission precludes a proper analysis of whether the benefits the Department claims would flow from the Proposed Changes outweigh the substantial direct and indirect costs they would impose on ERISA fiduciaries, their service providers and our public markets.

3. The analysis the NPRM and Proposed Changes require is poorly explained and involves considerations unrelated to the merits of a proposal.
4. The suggested “permitted practices” are internally inconsistent and offer uncertain protection for fiduciaries.

The NPRM Fails to Make the Case That the Proposed Changes Are Necessary and Reflects an Unwarranted Skepticism About Shareholder Voting, Shareholder Proposals and ESG Considerations

The NPRM offers three reasons rule making is necessary. The first, which is easily dispatched, consists of data regarding shareholdings by ERISA plans; specifically, that fewer shares are held directly by ERISA plans and a lower proportion of ERISA fund assets are invested in public equities.¹ The Department does not explain how those developments, which are characterized as “changed circumstances,” support the Proposed Changes, and we can identify no logical connection.

Second, according to the NPRM, ERISA fiduciaries “misunderstand”² their fiduciary obligations related to proxy voting and believe that they are required to vote all proxies regardless of economic impact on the plan. No evidence appears in the NPRM, nor could we locate any, supporting the notion that fiduciaries are confused about their obligations with respect to proxy voting. The Avon Letter, which the Department tries to blame for the alleged confusion, came out in 1988; since then, the Department has repeatedly (in 2008, 2016 and 2018) stated that fiduciaries do not have to vote all proxies in order to comply with their fiduciary obligations. For fiduciaries to be confused at this point, both they and their fiduciary counsels would have to have ignored or forgotten this guidance. Given how unlikely that is, it is incumbent on the Department to present some evidence that fiduciaries hold this mistaken belief or are acting in ways that reflect it. The NPRM contains no such evidence.

Relatedly, the Department urges that the problem of fiduciary confusion is “exacerbated” by the increase in the amount and types of shareholder proposals.³ Although more shareholder proposals are submitted now than in 1988, the total

¹ NPRM, at 11.

² NPRM, at 8.

³ NPRM, at 8.

number of proposals has leveled off in recent years.⁴ This argument also illustrates the skepticism about shareholder proposals and ESG considerations that permeates the NPRM, which asserts that fiduciaries' confusion "may be" leading them to act "in ways that unwittingly allow plan assets to be used to support or pursue proxy proposals for environmental, social, or public policy agendas that have no connection to increasing the value of investments."⁵ The Department apparently assumes that proposals addressing environmental, social and public policy issues by definition do not have an economic impact on the value of plan assets, which is at odds with substantial research (discussed in detail below).

Third, the NPRM urges that "research regarding whether proxy voting has reliable positive effects on shareholder value and a plan's investment in the corporation has yielded mixed results."⁶ The Department points to a few studies as showing this "mixed" result, but only two of those papers review actual empirical studies. Both Denes et al.⁷ and Yermack⁸ discuss studies showing both positive and negative impacts on firm performance from different kinds of shareholder votes. Denes et al. note that in more recent studies the relationship between shareholder proposals and firm value has tended to be positive, and Yermack synthesizes studies showing that the more recent tactic of withholding support from directors is associated with a range of positive outcomes, both of which contradict the Department's suggestion that the evidence regarding shareholder voting has shifted in a way that justifies the Proposed Changes.

The remaining studies are far afield from the NPRM's claims and provide no data relevant to the Proposed Changes. One, by Tracie Woitke, analyzes the relationship between activist public fund ownership of shares in companies and those companies' performance. The paper by James Copland criticizes proxy advisors, and Dorothy Lund's article analyzes the incentives passive investors allegedly have not to vote responsibly but does not include any voting data.

The NPRM does not address research directly on the impact of shareholder voting showing that it can enhance firm value. For example, a 2020 study found that the passage of a corporate social responsibility ("CSR") proposal generates positive

⁴ E.g., <https://corpgov.law.harvard.edu/2018/11/26/shareholder-voting-in-the-united-states-trends-and-statistics-on-the-2015-2018-proxy-season/> (reporting proposal volume peak in 2008 and decline between 2013 and 2018);

abnormal returns.⁹ Similarly, a 2012 *Journal of Finance* study estimated that the passage of a governance proposal causes a positive 2.8% cumulative abnormal return.¹⁰ “Vote no” campaigns against directors, in which shareholders withhold support from directors in uncontested elections, lead to operating performance improvements and more disciplinary CEO turnover, according to a 2008 study.¹¹ The Department’s failure to mention this literature renders its justification misleading and inadequate.

The NPRM Does Not Acknowledge or Weigh the Substantial Indirect Costs Imposed by the Proposed Changes

The NPRM acknowledges the substantial direct costs the Proposed Changes would impose, and provides an “illustration” in an effort to quantify them. However, it only glancingly mentions potential indirect costs that would flow from cutting back on voting by ERISA fiduciaries and their service providers, referring to but not discussing potential “externalities, public goods or other market failures” that could constitute “costs to society.”¹² As a result, the NPRM’s weighing of costs and benefits from the Proposed Changes is incomplete.

Our system of corporate governance rests on a balance of power among managers, the board and shareholders. Centralized management confers efficiency benefits, but also creates risks that management or directors will pursue actions at odds with shareholders’ interests such as embarking on value-destroying strategies or engaging in self-dealing transactions. Shareholders’ voting rights act as a check on such activities; shareholders can withhold support in director elections, veto transactions, express their views on executive pay, and endorse policy recommendations advanced in shareholder proposals. Research indicates that institutional investors like ERISA plans collect and analyze information more efficiently than other investors and are more effective monitors.¹³

Shareholders’ leverage is not limited to the votes themselves. The possibility of shareholder disapproval shapes companies’ actions, and companies put up for a shareholder vote proposals they have good reason to believe will pass. According to

⁹ Fernando Martins, “Corporate Social Responsibility, Shareholder Value, and Competition,” at 3 (Aug. 14, 2020) (https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3651240&download=yes).

¹³ See <https://clsbluesky.law.columbia.edu/2018/10/03/is-shareholder-voting-an-effective-corporate-governance-mechanism/>.

a recent study, the competition for votes “provides management and counterparties with incentives to take preemptive actions that will bring about greater net benefits for the company and investors.”¹⁴ The NPR views a policy of voting with management as benign because “nearly all management proposals are approved with little opposition,”¹⁵ but a lower likelihood of disapproval would be expected to lead to management proposals that are less value-maximizing. Those effects would likely be most pronounced where the interests of management and shareholders are least aligned, such as executive pay.

As we have argued in response to a recent rule making by the Department on ESG and investment choices, there is strong evidence of a link between superior ESG performance and firm financial performance. The NPRM ignores this literature, without explanation.

- A 2018 Bank of America study “found that firms with a better ESG record than their peers produced higher three-year returns, were more likely to become high-quality stocks, were less likely to have large price declines, and were less likely to go bankrupt.”¹⁶
- Deutsche Asset & Wealth Management and researchers from the University of Hamburg surveyed the academic literature and found that 62.6% of meta-analyses showed a positive relationship between ESG and corporate financial performance.¹⁷
- A 2010 study found that shareholder proponents target “firms that both underperform and have generally poor governance structures” and concluded that the evidence did not support the claim that proponents “pursue self-serving agendas.”¹⁸

Specific ESG considerations can also drive company performance. For example, empirical studies have found a consistent negative relationship between governance arrangements insulating boards from shareholder influence—which generally limit the effectiveness of shareholder voting--and company performance.

- An influential 2003 study found that companies whose governance provisions provided the strongest shareholder rights and lowest management power, as

measured using a governance index sometimes referred to as the “G Index,” outperformed those with the weakest shareholder rights and highest management power by a statistically significant 8.5% per year.

- Weaker shareholder rights were also associated with lower profitability and sales growth.¹⁹
- Classified boards are associated with lower firm value and less performance-sensitive compensation.²⁰

A Bank of America Merrill Lynch study “found that companies with high scores on gender/diversity measures, including board diversity, women in management and company policies on diversity/inclusion, generally saw lower subsequent price and EPS volatility and higher subsequent returns on equity than those with low scores.”²¹ Companies with one or more women on boards delivered higher average returns on equity, lower leverage, better average growth and higher price/book value multiples in a six-year Credit Suisse Research Institute study of 2,360 global companies.²²

Shareholder voting is essential to obtaining value-enhancing ESG reforms. Voting serves a communication function, and helps mitigate the collective action problem resulting from widely dispersed shareholdings in public companies.²³ The dramatic reduction in the proportion of large-cap public companies with classified boards—their number dropped by more than 50% from 2000 to 2012²⁴--was spurred by shareholder votes on the issue.²⁵ Similarly, shareholder campaigns pressing for greater board diversity led to a substantial increase in the proportion of S&P 500

Board seats held by women,²⁶ and significant reductions in the rate of executive pay increases have followed high levels of voting support on executive pay proposals.²⁷

The impact extends to companies that are not subject to proposals. As proponents began submitting proxy access shareholder proposals, some companies proactively adopted proxy access bylaws, and majority voting for director elections was implemented by some companies that were not targets of a shareholder proposal campaign on the issue.²⁸ A study by The Conference Board found that companies that were early proxy filers in 2011, when mandated management say on pay votes began, changed the terms of their pay programs to align pay more closely with performance and improved their disclosure even before any votes were cast.²⁹ In a recent study, peer companies improved their CSR performance after passage of a CSR shareholder proposal at a competitor.³⁰

Finally, shareholder voting can help mitigate systematic risks that can affect the value of a plan's portfolio. Under modern portfolio theory, risks across the portfolio (systematic risks) cannot be diversified away, making it rational for institutional investors to focus on obtaining better ESG disclosure and to use those disclosures when investing and voting proxies.³¹ The recent announcement by BlackRock, the U.S.'s largest asset manager and one of the "Big Three" passive investors, that it would accelerate its integration of sustainability considerations into its investment products and processes, illustrates this logic.³² Addressing risks associated with climate change at one company, for example, can not only reduce risks for other issuers of public equities but can also have an impact on the performance of assets in other asset classes such as real estate, timber or private equity whose value depends on mitigating sea level rise, availability of fresh water, or the prices of agricultural commodities.

The Analysis Required by the Proposed Changes is Not Feasible for Fiduciaries

To date, most fiduciaries have satisfied their duties under ERISA related to proxy voting by adopting proxy voting policies or guidelines that set forth the factors to be considered when voting on types of proposals. In formulating and updating these guidelines, fiduciaries review research on the value-relevance of different kinds of proposals, in addition to drawing on the experience of investment staff and service providers. Fiduciaries generally retain discretion to deviate from guidelines when doing so would be in the best interests of their plans. For example, many plans' guidelines consider outside auditor ratification to be a routine item and recommend a vote with management's recommendation, but also leave open the possibility of voting against ratifying the auditor where significant audit-related concerns exist.

The Proposed Changes would upend this cost-effective and sensible approach and require a vote-by-vote analysis of the economic impact of each proxy vote before a fiduciary can decide to cast it. As discussed above, we do not believe that the Department has provided sufficient justification for imposing the significant costs associated with such analysis. But putting aside cost concerns, the Proposed Changes and NPRM do not provide enough guidance for fiduciaries in carrying out this task, especially given the threat of fiduciary liability hanging over every analysis.

First, it is not possible for a fiduciary to have any sense of the economic impact of a proxy vote before results of that vote are tabulated and announced. ERISA plans are well-diversified, as the NPRM acknowledges, and thus no individual plan, by itself, can carry or defeat a proposal. Nor can a fiduciary know beforehand whether a plan's votes would make the difference between passage and defeat. Logic dictates that economic impact must depend, at least in part, on what company action the vote would prompt, which would turn on not just a particular plan's vote but the votes of all other shareholders.

For example, a fiduciary who believes that top executive incentive pay arrangements are encouraging underinvestment in the business might consider voting against management's say on pay proposal. Without knowing how other shareholders are going to vote, it would not be possible for the fiduciary to assess the likelihood that the plan's vote would help convince the company to alter its pay practices. A 20% no vote on a say on pay proposal almost certainly would have different consequences from a 40 or 60% no vote. Past Department interpretations allowed fiduciaries to consider whether the plan's exercise of shareholder rights, alone or with that of other shareholders, would be expected to impact the value of

the plan's investment,³³ but the NPRM is silent on that question. A fiduciary would need a crystal ball, then, to carry out the analysis contemplated in the NPRM.

The NPRM is also muddled about the distinction between the pre-vote economic impact analysis required under the Proposed Changes and the substantive decision of how to vote. The NPRM states, "Information that will better enable fiduciaries to determine whether or how to vote proxies on particular matters includes the cost of voting, including opportunity costs, the type of proposal . . . voting recommendations of management, and an analysis of the particular shareholder proponent."³⁴ It is not clear which factors should be considered in the pre-vote analysis and which in the actual voting determination. We note that, to the extent the pre-vote analysis incorporates factors such as current practices of the company and peers, the specific action proposed in the management or shareholder proposal, and company performance, the pre-vote analysis would substantially duplicate the voting analysis, limiting the ostensible benefits of the Proposed Changes.

The NPRM indicates that fiduciaries should take into account when determining the economic impact of a proxy vote the costs an issuer might incur from a failure to achieve quorum for the shareholder meeting.³⁵ That information would not be available to fiduciaries, though, and it is unreasonable to require fiduciaries to try to acquire it from issuers.

According to the NPRM, the plan's opportunity costs should also be considered in the economic impact analysis. Presumably, though no explanation is provided, the Department believes that the time a fiduciary spends determining how to vote on a single proposal could be spent on another value-generating activity. This absurd suggestion would be impossible to implement. It is difficult to imagine the kinds of alternative activities in which a fiduciary might engage in the small amount of time typically spent analyzing a single proxy vote. Even if such hypothetical activities can be identified, how should fiduciaries value them?

The NPRM states that a fiduciary should consider "an analysis of the particular shareholder proponents" when deciding whether and how to vote on a proposal.³⁶ No explanation is provided about how a proponent's identity affects the economic impact of a proposal. We have seen no research indicating that the value of a governance change depends on the identity of the shareholder advocating for it. If

³³ Interpretive Bulletin 2016-01; Field Assistance Bulletin 2018-01.

³⁴ NPRM, at 21.

³⁵ NPRM, at 28 fn. 63. The fact that the Department went out of its way to clarify that a fiduciary may depart from a permitted practice in order to help a company make quorum at a meeting supports a conclusion that considerations other than maximizing the value of plan assets motivated the issuance of the NPRM.

³⁶ NPRM, at 21.

such research exists, the Department should describe it and explain how it relates to a fiduciary's analysis of a proposal.

Given the challenges outlined above, we believe that the Proposed Changes cannot be implemented by fiduciaries without significant risk of inadvertent noncompliance. The NPRM therefore should be withdrawn.

The Permitted Practices Are Internally Inconsistent and Offer Uncertain Protection to Fiduciaries

The NPRM concedes that the extensive and particularized cost-benefit analysis required by the Proposed Changes would be “resource-intensive” and “may often burden fiduciaries out of proportion to any potential benefit to the plan.”³⁷ That acknowledgement bolsters our belief that the Department has imposed the vote-by-vote economic analysis requirement in order to steer fiduciaries toward the permitted practices, which allow fiduciaries to select types of proposals on which to abstain from voting or to vote in accordance with management's recommendations. Those practices, however, are internally inconsistent and are not designed to maximize the value of plan assets.

The permitted practices would provide illusory protection for fiduciaries. The permitted practice in which the fiduciary may decide to vote with management on specific kinds of proposals is “subject to any conditions determined by the fiduciary as requiring additional analysis because the matter being voted upon concerns a matter that may present heightened management conflicts of interest or is likely to have a significant economic impact on the value of the plan's investment.”³⁸ To determine whether this exception applies, a fiduciary would need to engage in the exact vote-by-vote analysis that the permitted practice was supposed to allow the fiduciary to avoid. The NPRM does not explain how a fiduciary could monitor for such exceptions in a cost-effective way.

The Department defends this permitted practice of following management's recommendations by noting that officers and directors owe “their own” fiduciary duties to the corporation, implying that those duties are sufficiently similar to ERISA fiduciaries' duties that reliance upon their judgments is a sound practice.³⁹ However, fiduciary obligations under state corporate law are limited in order to avoid excessive risk aversion, most importantly by the powerful business judgment rule, which presumes that officers' and directors' decisions were informed, in good faith, and made in the honest belief that the action taken was in the best interests

³⁷ NPRM, at 24-25.

³⁸ NPRM, at 26.

³⁹ See NPRM, at 21 fn. 52, 26.

of the company.⁴⁰ A shareholder cannot enforce director and officer fiduciary duties without showing that it made demand on the corporation or that such demand would be futile; ironically, in *Aronson v. Lewis*, the case cited by the Department, the complaint was dismissed for failure to plead demand futility. Both procedurally and substantively, then, corporate law's fiduciary duties are no substitute for those owed under ERISA.

Another permitted practice would allow a fiduciary to refrain from voting altogether when the plan's holding in an issuer relative to the plan's total assets is below a quantitative threshold such that the matter being voted upon is unlikely to have a "material impact on the investment performance of the plan's portfolio." The NPRM requests comment on a possible threshold of 5%.⁴¹ A diversified ERISA plan would not invest 5% or more of total plan assets in stock of a single issuer, so this kind of rule of thumb would end up disenfranchising plans entirely. Moreover, this permitted practice introduces a "materiality" concept, which goes far beyond the cost-benefit analysis required of fiduciaries under the Department's sub regulatory guidance. The Department must acknowledge this break with prior guidance and explain why materiality would be appropriate in this context.

Given the thin and unbalanced economic analysis underpinning this proposal, and the obvious costs that it would impose on ERISA plans, one can only interpret the NPRM as an ideological attack on the concept of shareholder engagement on environmental, social, and governance issues. As a coalition of investors who have engaged effectively and productively with corporations on such issues for 50 years, we take exception to this bias and adamantly oppose this rule.

For all of the above reasons, we strongly urge the Department to withdraw the NPRM and not adopt the Proposed Changes. We appreciate this opportunity to provide our views on this important matter. Please feel free to contact Josh Zinner (jzinner@iccr.org) with any questions.

Sincerely,

Josh Zinner
