

Notice Of Exempt Solicitation: (VOLUNTARY SUBMISSION)
NAME OF REGISTRANT: Valero Energy
NAME OF PERSON RELYING ON EXEMPTION: Majority Action
ADDRESS OF PERSON RELYING ON EXEMPTION: PO Box 4831, Silver Spring, MD 20914

Written materials are submitted pursuant to Rule 14a-6(g)(1) promulgated under the Securities Exchange Act of 1934.
Submission is not required of this filer under the terms of the Rule but is made voluntarily.

Valero Energy [NYSE:VLO]: Due to the Company's Failure to Set Adequate Net Zero by 2050 Target, Realign Investment Plans to Limit Global Warming to 1.5°C, and Ensure Alignment of Policy Influence Activities:

- **Vote AGAINST Chair and CEO Joseph Gorder (Item 1.c), and**
- **Vote AGAINST Lead Director Robert Profusek (Item 1.i)**

The physical and financial risks posed by climate change to long-term investors are systemic, portfolio-wide, unhedgeable and undiversifiable. Therefore, the actions of companies that fail to align to limiting warming to 1.5°C pose risks to the financial system as a whole, and to investors' entire portfolios, in addition to specific risks to those companies. See **Appendix A** for more information regarding Majority Action's Proxy Voting for a 1.5°C World initiative and the transformation required in key industries.

Valero is the world's largest independent refiner, with fifteen petroleum refineries in the U.S., Canada and the United Kingdom.^[1] It is among the 167 target companies named by Climate Action 100+ as the largest global emitters and "key to driving the global net-zero emissions transition."^[2]

Petroleum and fossil gas products, including those used in transportation, buildings, industrial processes, and electricity production, account for nearly 80% of carbon emissions from the U.S. energy system.^[3] The U.S. is the largest petroleum and fossil gas producer in the world, having overtaken Saudi Arabia and Russia in recent years.^[4] To stay within the available carbon budget to limit warming to 1.5°C, oil and gas companies must not just decarbonize their own emissions, but global consumption of fossil fuels must fall as well.^[5] In 2021, the International Energy Agency (IEA) set out the implications of a 1.5°C pathway for the oil and gas sector in its "Net Zero by 2050" scenario (NZE). Under the NZE, fossil fuel use **falls dramatically** and can be satisfied with existing assets, with **no need to invest in new oil and gas fields.**^[6]

Failure to set ambitious decarbonization targets in line with 1.5°C pathways, and align companies' business plans and policy influence to those targets, is a failure of strategy and corporate governance for which long-term investors should hold directors accountable. At companies where the production, processing, sale, and/or consumption of fossil fuels is central to their core business, and greenhouse gas (GHG) emissions reductions have profound strategic implications, the board chair, and lead independent director where the position exists, should be held accountable.

Failure to set adequate net zero targets

Net zero by 2050 commitment that covers all relevant emissions sources, in particular Scope 3 emissions from the burning of products sold, and on a full equity share basis	X
Net zero commitment has limited use of offsets, negative emissions, or unproven or uncommercialized technologies, including carbon capture and storage	X
Company has adopted robust interim targets, including substantial reductions by 2030	~

Valero has not set a net zero by 2050 ambition^[7] and has instead set two interim targets to reduce and offset emissions from scopes 1 and 2, first by 63% from 2011 levels by 2025, and then 100% by 2035.^[8] In its 2021 TCFD Report and Scenario Analysis, the company details the breakdown of its expected reductions and offsets compared to a 2011 baseline, with only 7% coming from *absolute* reductions (from efficiencies) and the majority expected to be offset by the production of ethanol and renewable diesel.^[9] However, the projected emissions savings associated with ethanol and ‘renewable’ fuels may be lower than expected; recent research shows GHG emissions associated with direct and indirect land-use changes related to crops used for bio-based fuels, namely soybeans and corn, may be more significant than previously understood.^{[10] [11] [12]}

The company expects to offset 11% through carbon capture and storage projects at its ethanol plants,^[13] which would necessitate the building of more than 1,200 miles of new gathering and transportation pipelines.^[14]

Capital allocation and investment plans not aligned with 1.5°C pathways

Company has a plan to realign capital expenditures to meet a net zero decarbonization commitment, including substantial reductions in production in line with the IEA Net Zero by 2050 Scenario.	X
--	---

According to the Climate Action 100+ Net-Zero Company Benchmark, Valero had not, as of December 31, 2021, met any of the indicators for capital allocation alignment; to do so, the company would need to commit to align future capital expenditures with its own long-term GHG reduction target(s) and with the Paris Agreement’s objective of limiting global warming to 1.5° Celsius, and disclose the methodology it uses to determine such alignment.^[15]

In its 2021 TCFD Report and Scenario Analysis, Valero assesses its business strategy to the IEA's Sustainable Development Scenario (SDS), which aligns to a "well below 2" degree scenario, but does not address how it could align business to the IEA's NZE Scenario or how the company will align its operations to a 1.5°C pathway.^[16]

A Carbon Tracker analysis from September 2021 rated Valero's financial statements as "significant concern" for investors due to the company's lack of transparency on climate-related assumptions.^[17]

Misalignment of policy influence activities with net zero commitment and 1.5°C pathways

Alignment of policy influence activities with net zero target and limiting warming to 1.5°C

X

According to InfluenceMap, Valero received a near-failing E grade for its obstructive climate policy engagement.^[18] The only Climate Action 100+ Net-Zero Company Benchmark indicator that Valero has met is the disclosure of its trade associations and memberships.^[19]

Shareholder Proposal Related to Climate

There is one climate-related shareholder proposal on Valero's 2022 proxy statement. Mercy Investment Services along with several asset owners filed a resolution requesting that the company disclose near & long-term GHG reduction targets aligned with the Paris Agreement's goal of maintaining global temperature rise at 1.5°C, and a plan to achieve them across all scopes.^[20]

This proposal also recommends the company consider committing to reduce local community health impacts from cumulative operational emissions in its target setting process. The Political Economy Research Institute (PERI) ranks Valero as the 40th worst toxic air polluter in the U.S., with 64% of the environmental health risk from Valero's refineries borne by people of color.^[21] As You Sow's Racial Justice Scorecard for S&P 500 companies ranks Valero in the bottom ten, with negative scores on the environmental racism performance indicators.^[22]

Conclusion: Valero has failed to set adequate net-zero targets, align its capital investments with limiting warming to 1.5°C, or ensure its policy influence activities would support doing so. Therefore, we recommend that shareholders vote AGAINST Chair and CEO Joseph Gorder (Item 1.c), and vote AGAINST Lead Director Robert Profusek (Item 1.i) at the company's annual meeting on April 27, 2022.

Appendix A: Proxy Voting for a 1.5°C World

The world is currently on track to reach disastrous levels of warming, driving massive harm and threatening the lives and livelihoods of millions. Corporate leaders in the industries responsible for this crisis have failed to take up the leadership required to change course.

“Climate risk” is systemic, escalating and irreversible - and corporate boards urgently need to take responsibility for averting and mitigating this risk.

The UN Intergovernmental Panel on Climate Change (IPCC) in 2018 made clear that in order to have at least a 50% chance of limiting warming to 1.5°C and avoiding the most catastrophic effects of the climate crisis, we must bring global, economy-wide carbon emissions down to net zero by 2050 at the latest.^[23] According to the International Energy Agency (IEA), in order to achieve net zero emissions globally by 2050, the electricity sector must reach net zero emissions in OECD countries no later than 2035 and there can be no investment in new fossil fuel production.^[24] The IPCC also recognizes that reducing rates of deforestation and forest degradation also represents one of the most effective and robust options for climate change mitigation.^[25]

That means that corporate directors must ensure that companies set ambitious decarbonization targets in line with 1.5°C pathways, and align companies’ business plans, capital expenditures, and policy influence to those targets. Despite the escalating climate crisis, systemically important U.S. companies continue to invest in the expansion and continued use of fossil fuels, further accelerating global warming.^[26]

The physical and financial risks posed by climate change to long-term investors are systemic, portfolio-wide, unhedgeable and undiversifiable.

Therefore, the actions of companies that directly or indirectly impact climate outcomes pose risks to the financial system as a whole and to investors’ entire portfolios. In order to manage this systemic portfolio risk, investors must move beyond disclosure and company-specific climate risk management frameworks and focus on holding accountable the relatively small number of large companies whose actions are a significant driver of climate change.

When directors fail to transform corporate business practices in line with 1.5°C pathways, responsible investors must use their most powerful tool – their proxy voting power – to vote against directors.

Bold and unprecedented action by investors is a prerequisite to averting further global economic and financial catastrophe. While past shareholder efforts at standard setting, disclosure and engagement have laid important groundwork, company commitments won thus far have been far too incremental, far too hard fought, and collectively insufficient to the scale of the crisis.

Business-as-usual proxy voting will not suffice to address the seriousness of the crisis at hand. We urge investors to vote against directors at companies failing to implement plans consistent with limiting global warming to 1.5°C.

Key Sectors Are Critical to Curbing the Climate Crisis

The electric power, finance, transportation, and oil and gas sectors are key drivers of the production and consumption of fossil fuels and must all make dramatic transformations to curb the worst of catastrophic climate change and protect long-term investors. Similarly, companies driving deforestation – including companies that source key deforestation-linked agricultural commodities, driving market demand for one of the greatest threats to the world’s forests – must adopt comprehensive climate policies and end deforestation.

Substantial votes against board members at these companies could help encourage ambitious target-setting, realign business and investment plans to the goals of the Paris Agreement, and hold companies accountable for lobbying and policy influence practices that obstruct climate action.

While each industry and company will need to chart its own path in pursuing decarbonization consistent with limiting warming to 1.5°C, setting a target to reach net zero emissions by no later than 2050 is a critical first step. In the absence of such a target, investors can have no confidence that the company will be able to transform its business consistent with limiting warming to 1.5°C.

Voting Guide: Oil & Gas

Petroleum and fossil gas products, including those used in transportation, buildings, industrial processes, and electricity production, account for nearly 80% of carbon emissions from the U.S. energy system.^[27] The U.S. is the largest petroleum and fossil gas producer in the world, having overtaken Saudi Arabia and Russia in recent years.^[28] In general, U.S. oil companies lag behind their European peers in adopting net zero by 2050 ambitions^[29], or investing in renewable energy production.^[30]

To stay within the available carbon budget to limit warming to 1.5°C, not only must oil and gas companies decarbonize their own emissions, but global consumption of fossil fuels must fall as well.^[31] In May 2021, the IEA set out the implications of a 1.5°C pathway for the oil and gas sector in its “Net Zero Emissions by 2050” scenario (NZE).^[32] Prior IEA scenarios such as the Beyond 2°C Scenario (aligned to limiting warming to 1.75°C by 2060^[33]) and the Sustainable Development Scenario (aligned to the Paris Agreement’s upper target of well below 2°C^[34]), still fell short of limiting warming to 1.5°C.

Under the NZE, fossil fuel use falls dramatically and can be satisfied with existing assets, with no need to invest in new oil and gas fields, and no new coal mines or mine extensions.^[35] However, according to analyses by Carbon Tracker, the world’s largest oil companies have projects both sanctioned (those currently producing or under development) and unsanctioned (those not yet under development) over the course of the next two decades that would exceed the carbon budget for 2.0°C of global warming, let alone 1.5°C.^[36] This signals that many companies are not yet fully committed to meaningful reductions. While oil demand fell in 2020 due to COVID-19 disruptions,^[37] oil demand and pricing are currently rebounding,^[38] and any expansion plans are fundamentally at odds with the immediate global production reductions required within most Paris Agreement-aligned scenarios.^[39]

As shale-focused companies rely primarily on continued new drilling to sustain production, these companies are particularly at risk: in order to limit warming to 1.5°C and be aligned with the IEA NZE, shale-focused companies in particular must reduce production by more than 80%.^[40] However, many U.S. companies continue to expand into shale-rich regions such as the Permian Basin^[41] (see Capital Allocation section). The Permian is predicted to account for much of the growth in US oil production, and much of this will likely be exported and burned overseas; an Occidental Petroleum company executive recently noted the trend by saying “every single molecule from here on out has to be exported.”^[42]

Target setting

To avoid the risk of global temperature overshoot, emissions need to fall by 45% from 2010 levels by 2030, reaching net zero by 2050.^[43] Net-zero commitments should also incorporate interim targets and milestones that allow accelerated emissions reduction between now and 2030 rather than delaying the hard task of emissions reduction until after that date. Net zero commitments must cover projects on a full equity share basis, such that all joint ventures and subsidiaries are covered by the company-wide target. Companies should achieve net zero by 2050 with limited use of offsets, negative emissions, or unproven or uncommercialized technologies, including carbon capture and storage (CCUS). Relying on CCUS—rather than phasing out the production of fossil fuels—is a risky strategy^[44]; even pro-CCUS sources acknowledge that many proposed CCUS technologies are as yet unproven, and a massive infrastructure investment and buildout would be required to capture enough carbon to limit warming to 1.5°C.^[45] Oil and gas companies should clearly disclose specific plans to use offsets or negative emissions to achieve net zero emissions by 2050, so that investors may assess the quality and credibility of their plans.

Capital allocation

Given that oil supplies currently in production already exceed the carbon budget for limiting warming to 1.5°C, oil and gas companies must immediately cease approving investment in new projects that fall outside the carbon budget. At minimum, Arctic and oil sands projects should be halted because they are inconsistent with limiting warming to 1.5°C^[51], economically marginal due to elevated production costs, and carry additional environmental and human rights risks.^[52]

Oil production in the Permian Basin in Texas and New Mexico – almost entirely fracking^[53]—has nearly quadrupled from 2010 to today,^[54] while natural gas production has more than tripled.^[55] According to an analysis conducted by Oil Change International, carbon emissions from Permian oil and gas production through 2050 could alone exhaust nearly 10% of the global 1.5°C carbon budget.^[56] The climate impact of Permian oil and gas is even greater than coal based on the amount of methane that escapes into the atmosphere during hydraulic fracking.^[57] It is estimated that the Permian Basin has a 60% higher methane leakage rate than other U.S. oil and gas regions.^[58] Given that the vast majority of these emissions would come from wells not yet in production at the end of 2020, much of these emissions could be avoided if companies simply halted all drilling of new wells.^[59]

Investors should use the NZE scenario as a floor to assess companies' climate policies, transition scenarios and capital allocation alignment. Importantly, no new oil or gas fields should be approved for development under a 1.5°C pathway; no investment in new oil and gas production should be undertaken,^[60] and production levels must fall by the 2030s.^[61] Under such a scenario, asset stranding of additional production assets as well as existing assets is a major risk to investors.^[62]

Policy influence

Oil and gas companies must fully align their policy influence activities, including political spending and lobbying, with the policy settings required to accelerate sector-wide emissions reductions on a timeline necessary to limit warming to 1.5°C. Oil and gas companies must provide full disclosure of all political and lobbying spending in all jurisdictions to allow investors to assess this alignment. Finally, companies must ensure the alignment of the policy influence activities of any trade associations or similar entities of which they are members or to which they contribute with 1.5°C outcomes, or cease membership of such organizations.

Summary table

TARGET SETTING	1.1	Net zero by 2050 commitment that covers all relevant emissions sources, in particular scope 3 emissions from the burning of products sold, and on a full equity share basis
	1.2	Net zero commitment has limited use of offsets, negative emissions, or unproven or uncommercialized technologies, including carbon capture and storage
	1.3	Company has adopted robust interim targets, including substantial reductions by 2030
CAPITAL ALLOCATION	2.1	Company has a plan to realign capital expenditures to meet a net zero decarbonization commitment, including substantial reductions in production in line with the IEA Net Zero by 2050 Scenario
POLICY INFLUENCE	3.1	Alignment of policy influence activities with net zero target and limiting warming to 1.5°C
